The PDF Viewer

Emetos opens PDF files in a tab of their own. The pages are drawn by Poppler, the free PDF library that most Linux desktops already have, and scrolled continuously, one under the other.

Only the pages in view are drawn, with the one before and the one after them, at the resolution of the screen. A zoom scales the pictures it has at once and draws them again a moment later, so zooming stays smooth on long documents.

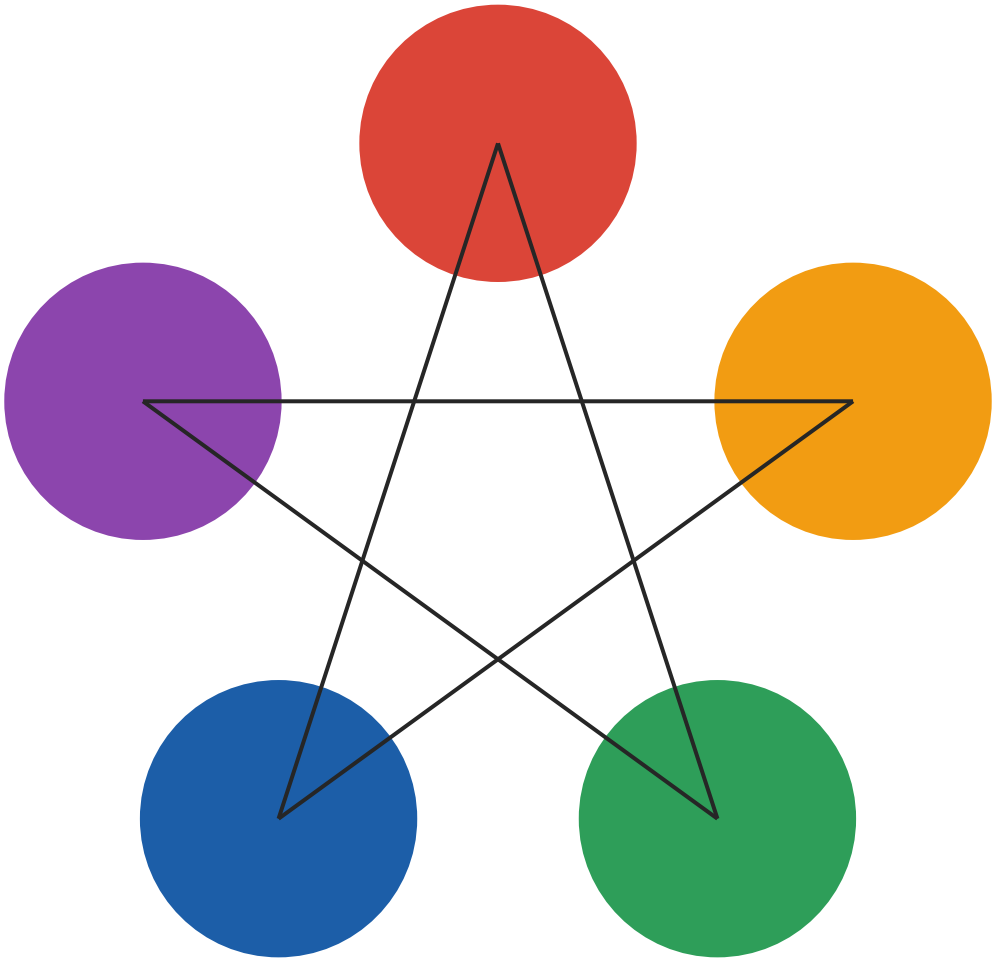
What the toolbar does

Previous and Next go a page up or down. The page box shows the page in view; type a number and press Enter to go there. Zoom Out, Zoom In and the zoom pick change the size: Fit Width, Fit Page, or a level from 50% to 400%.

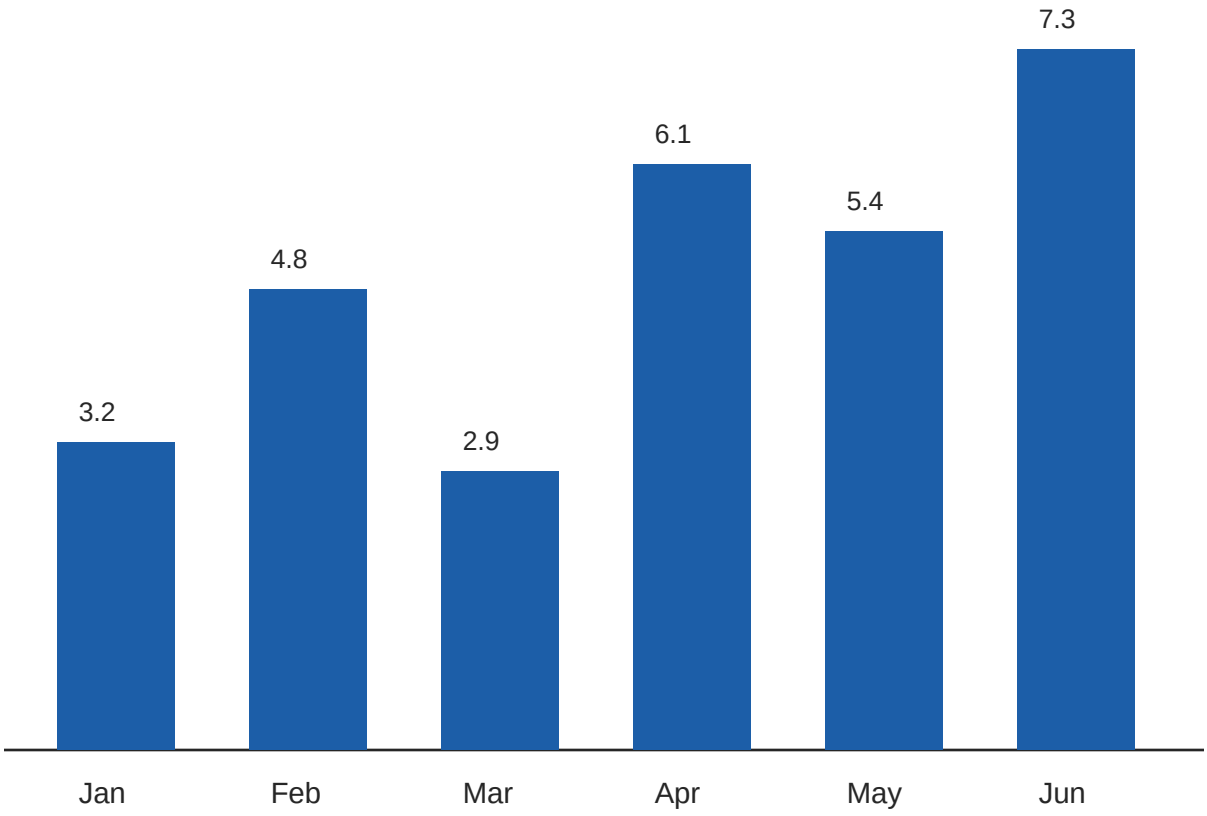
```
Keys: Page Up and Page Down, Home and End, Ctrl+= and Ctrl+-,
and Ctrl+G to type a page number.
```

A drawing

Vector shapes stay sharp at every zoom: they are drawn again at the new scale.



A chart



The end
